This map shows, for each Health Service Area, the percentage of primary care physicians under age 65 as of 1-1-2012 who will have reached age 65 by 2021. Physician counts are based on a data set of all physicians licensed in Wisconsin as of 3-15-2012. Primary care physicians are those who listed their practice specialty as general practice, family medicine, internal medicine, pediatrics, medicine-pediatrics or geriatrics, without a medical subspecialty. Many of the physicians identified as primary care in the licensure record may in fact be working exclusively as hospitalists or in urgent care or residential facility settings only. Others may have significant administrative, teaching and research responsibilities. For purposes of these retirement estimates, all primary care physicians were included regardless of principal work setting.

Physician location reflects the city listed in the address of record in the licensure file. For physicians under age 65, this is presumed to reflect the service area of the physician’s practice, if not the specific practice location. Comparison to information provided on a survey linked to this same group of physicians at the time of licensure in 2011-12 supports this assumption for rural areas and most other parts of the state. In the sub-areas of central Milwaukee, however, there is more variation between a physician’s address of record and primary practice location.

Primary Care Physician Retirement

Overall, Wisconsin physicians begin reducing patient care hours around age 55, but many work past age 65. Closer analysis of primary care physician data indicates that the group continuing to practice after age 65 offsets to some extent the group reducing hours prior to age 65. (See Wisconsin Physician Workforce Report, October 2012, at www.ahec.wisc.edu/workforce .) Age 65 provides a consistent marker for an initial projection of physician retirement, since that information is available for all physicians in the 2011/12 licensure data set and would be available in any similar data set drawn at a future date.

If a typical physician has a 35 year career (from the conclusion of residency training at about age 30 until about age 65), and there is an even distribution of the current workforce by age, one would expect about 10/35ths of the workforce to retire each decade, or 28.6%. This is what we might expect for the state as a whole. However, in the smaller service areas, an even age distribution is less likely, and the retirement of one physician will have a much larger impact on access to care particularly if the area already has a high population to physician ratio. In Wisconsin, 75 Health Service Areas will have more than 30% of physicians reaching age 65 between 2012 and 2021. Many of these areas are already experiencing shortages.

www.ahec.wisc.edu/workforce

June 2015
The age of the current workforce is just one factor in predicting future supply. Change in retirement patterns (working longer or retiring earlier), decrease in average hours worked, or an increase in the number of Wisconsin residency positions are also important considerations. Demand will be influenced by demographic change, expanded insurance coverage, and changes in the organization of healthcare delivery, including increased use of physician assistants and advanced practice nurses. For more information on the potential impact of all these factors, see Projection of Physician Supply and Demand in Wisconsin through 2025 at www.ahec.wisc.edu/workforce.

Chart A, below, shows the distribution of Wisconsin physicians by age as of 1-1-2012. Chart B shows status (full time, part-time, no patient care) of primary care physicians, based on responses to the 2011/12 Wisconsin Physician Survey. Chart C maps the number of physicians reaching age 65 by the year 2021 compared to the current population to provider ratio in each service area. Tables 1 and 2 summarize potential retirement patterns over the next 15 years by region and by urban or rural service area type. Chart D and Table 3 show these patterns in 5 year increments through 2036. Chart E compares the projected retirement for primary care physicians to the number of physicians graduating from Wisconsin primary care residencies through 2036. Table 4 provides information on potential retirement patterns for each service area. Population to physician ratios in all tables and charts use the 2010 U.S. Census totals for Wisconsin as a base.
Chart C

Projected Primary Care Physician Retirement and Population to Office-Based Patient Care FTE* Ratio >2000:1

Service Areas with high population to provider ratio and high potential retirement 2012-2021

| Type 1: Metro | Grafton, Janesville, Sheboygan, |
| Type 2: Other Urban | Burlington, Watertown, Waupun |
| Type 3: Mixed-L, hub > 10,000 | Menomonie city, Monroe |
| Type 4: Mixed-M, hub < 10,000 | Columbus, Mt. Horeb, Oconto, Reedsburg, |
| Type 5: Rural-M, hub > 2500 | Antigo, Arcadia, Baldwin, Boscobel, Chilton, Darlington, Kewaunee, New London, New Richmond, Oconto Falls, Portage, Pulaski, Shawano, Stanley, Sturgeon Bay, Wisconsin Dells, |

*Based on 2012 licensure data for Wisconsin-based physicians under age 65, adjusted to reflect office-based patient care practice only and standardized to a 40-hour work week for practice. Population totals are from the 2010 census. Rates include only physicians with Wisconsin licensure and assume Wisconsin residents seek care in Wisconsin. Ratios for border areas could be somewhat higher or lower depending on the local circumstances.

For more information on the Wisconsin health workforce and the health service areas geography used for this map, see www.ahec.wisc.edu/workforce.
For convenience in summarizing certain kinds of data, service areas are grouped into 17 regions around the closest source of tertiary care. With the exception of Rhinelander in northern Wisconsin, each region includes a city of greater than 50,000, or is adjacent to a metropolitan area in a neighboring state (Duluth, Minneapolis, Dubuque). Note that each region may include metro, urban and rural service areas. Summary data by region may obscure significant within-region variation.

*Projected retirement rates: Assuming a 35 yr career beginning at age 30 and an even age distribution across all age groups, for the state as a whole the expected % of individuals reaching age 65 would be as indicated below. Higher rates are bolded in the table. Note that service areas with less than 7 physicians could not have a consistent 5 yr retirement rate, even under ideal circumstances.
Table 3. Number of primary care physicians in current workforce reaching age 65 in the years indicated
